

Dear SOLO Business Partners within and outside of Germany,

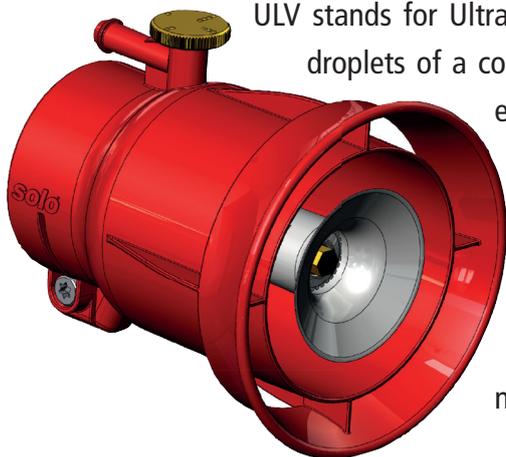

While the year 2020 has so far been anything but easy for all of us, we do not want to lose our focus on the future. Irrespective of all the obstacles, time does not stand still. Today we would like to present to you two new and interesting products that will be available during the forthcoming calendar year.

Battery powered Back Pack Sprayer SOLO 442

The SOLO 442 will expand our range of battery driven products. The sprayer is light and robust, will have a fill volume of 16 litres, is designed for the professional market and features a new high performance and replaceable battery system. The operating pressure can be regulated from 1 to 4 bar by pushing a key on a panel. The SOLO 442 is supplied complete with a 2 Ah battery and a standard charger. As separate accessories we will also be offering a 5 Ah battery and an express charger. The new SOLO 442 is expected to go into production during the first half of 2021.

New ULV Nozzle

ULV stands for Ultra Low Volume, i.e. the application of very fine droplets of a concentrated liquid. This nozzle has special use for plant protection but is especially used for vector control, i.e. to reduce and restrict disease carriers such as stinging flies and other harmful insects, that requires this application method around the world. The powerful air stream of the SOLO Port 423 or SOLO Master 452 propels the rotor within the housing of the ULV nozzle to disperse the spray liquid into very fine droplets. This method produces a much improved droplet size spectrum. The new ULV nozzle will be available early in 2021.

Over the forthcoming weeks we shall send you more detailed information for these 2 new products. Currently we do have quite a range of product developments in the pipeline for 2021 and we are looking forward to submit details to you as we get closer to their presentation.

Your SOLO Team
